Complete Paired Feature Counts

Counts cover three primary pairs and five supplementary pairs. Rows use the first item in each pair; columns use the second. Each applicable feature has 174 paired observations.

Explanatory links use categories 0, 1, 2; actor relations and concrete comparison use 0, 1; explicit error uses 0, 1, U. U is uncertain error status. “Not paired” means that concrete comparison was not applicable to both questions.
